The invention provides matrials for acroning for a subcrate. Showing afficity for a melatonin receptor protein, which conding a number of the part of the gene encoding a human melatonin receptor protein. The cells are useful for screening for human melatonin receptor protein. The cells are useful for screening for human melatonin receptor proteins and its agents to ractioned to be formed as which location and according charges it metabolic activity. The receptor temporal melatonin receptor protein is useful as it has the same activity as natural human melatonin receptor protein. The time streening melatonic section are receptor protein to use streening melatonic before protein the time streening melatonic which uses antibodies produced by linking melatonic which uses antibodies produced by linking

receptor, which is a membrane protein, coupled to quantine including fractions (G-proteins). The gene has been cloned by polymerase chain reaction amplification of human genomic DNA, using protein grave the first the XD-quart laws a probe to obtain clone T0949. Screening of a human hypothalamus xDNA library has resulted in isolation of the full length clone. Primers T0995-56 amplify a 255-bp band of the gene, and have been used with probe T09462 to analyse the tissue distribution of this gene for comparison with the membrane which interact with melatonin, or specific antibodies, may be used as receptor-agonists or receptor-annagonists. Agonists may be used in therapy of circadian rhythm disorders such as jet-lag or day-night
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             06-JUN-1995:
